## How to Address Humidity, Condensation and Container Rain

### How Do I Address Humidity?

**Hybags** are a High Absorbency option for continuous dehumidification throughout the container journey. We offer various formats available depending on your specific application.

### How Do I Address Condensation?

The **Hyblanket** creates a barrier to keep goods dry against ceiling container rain/condensation which places goods at risk of things like mold, corrosion, infestations, and collapsed boxes.

The **Kit Bond** creates a wall barrier further protecting goods from wall moisture/condensation. In addition, the floor piece protects against floor moisture.

The **Hypad** absorbs floor moisture from leaky type goods such as recycled materials, hides or any export that may excrete moisture.

We offer custom sizes based on the application.

### How do I address both humidity and excess moisture such as condensation?

All of our **Hy Series** can be combined to create optimum solutions for your specific application.
